SHARON HIGBIE
Executive Secretary

Fellow Oklahomans:

Oklahoma's two main agricultural commodities are cattle and wheat. By far, cattle is the most important agricultural enterprise in the State. In 1984 cattle and calves provided nearly 54% of the State's total cash receipts from the sale of farm and ranch marketings. Our cow and calf ranches, our stocker/steer operations, and our feedlots all contribute their share to this important agricultural industry. Oklahoma's cattle inventory in January 1986 ranked fourth in the nation, and our beef cow inventory ranked third behind Texas and Missouri. The latest figures show that Oklahoma's cattle industry is valued at 1.7 billion dollars. Without a doubt, the beef cattle industry in Oklahoma is No. 1 in Agriculture.

This statistical measure of the State's agriculture is made possible by farmers and ranchers who have supplied survey data on their individual operations, as well as data from grain elevators, slaughter, and other agribusinesses. I offer my sincere thanks to each one who voluntarily supplied information and helped insure the accuracy of these data.

Sincerely,

Jack D. Craig

Jack D. Craig
President

Presented in this report are measures of Oklahoma's agricultural production. These agricultural statistics are based on survey responses from farmers, ranchers and agri-businesses. We wish to express our appreciation to all of the respondents who voluntarily participated in the sample surveys.

The office staff who prepared these agricultural statistics are Agricultural Statisticians Burt Bartlett, Daryl Brinkman, Riley Henderson, Monnie Miller, Dave Ranek, and Ramona Taylor. The program support group includes Sharon Adams, Juanita Davis, Charlotte Gamble, Beverly Masquat, Mary Onarsee, Nancy Parsons, Alberta Penix, Mary Sheffert, Kathy Sherfield, Ila Mae Spiva, Diane Suman, Marilynn Vreeland, and Joanne Weece.

This publication was assembled under the guidance of Burton Bartlett with assistance from support personel.

Current reports and forecasts may be obtained by writing the Commissioner of Agriculture or the State Statistician.

Sincerely,

John Waldrop

John Waldrop,
State Statistician

OKLAHOMA CROP AND LIVESTOCK REPORTING SERVICE

SAMPLING METHODS AND ESTIMATION

The data collection program of the Crop and Livestock Reporting Service consists of surveys designed to produce current agricultural statistics of acreages, yield and production of crops, livestock and poultry inventories, and other information pertaining to Oklahoma's agricultural economy.

The most important source of survey data is the farm operator who voluntarily supplies information about his farming operations. Most surveys include a fairly large sample of operators which are surveyed by mail. Some producers may be in a smaller pre-selected probability sample in which responses are collected by personal interview or by telephone.

Data are also collected from agribusiness firms and merchants serving agriculture. Both suppliers of agricultural inputs and purchasers of raw farm outputs are important sources for developing statistics on agricultural commodities. In addition, these firms can also provide valuable data on quantities marketed or processed, which are used as check data to revise earlier estimates made from sample surveys. Data from these sources are especially useful in the nonprobability mail surveys.

Survey methods have changed significantly during the past two decades and many different sampling and surveying techniques are used currently. Lists of farm operators, including names and addresses, are used for many of the surveys and are well suited for the collection of information by mail. The low cost of data collection from a list sample is one of the principal advantages of this method. Another advantage is the ease with which supplementary information can be included and used to classify operations as to type and size. This allows the use of efficient stratified sample designs.

Today, many probability surveys, using personal interviews and actual field counts to collect data, supplement the mail approach. Enumerative surveys require the collection of survey data pertaining to specific land areas (segments). In Oklahoma, a sample of 360 segments which average approximately one square mile in size are enumerated each year. The information collected is used to supplement mail surveys to provide indications on crop acreages and livestock numbers. Objective counts and measurements are taken each month throughout the growing season from 200 randomly selected wheat yield plots. This information is used to supplement indications of wheat yield provided by the mail responses from monthly crop reporters. The enumerative and objective yield field activities are conducted by approximately 40 part-time enumerators whose work helps provide information for preparing more reliable statistics.

The Oklahoma Crop and Livestock Reporting Service also participates in a research project called AGRISTARS. The primary objective of this project is to make use of satellite information to improve the precision of crop estimates at the state, crop reporting district and county levels. Another goal is to develop methods which will give early warning to the agriculture industry of changes in crop conditions that may affect production. The project is a cooperative effort of the U. S. Departments of Agriculture, Commerce and Interior, NASA, and the Agency for International Development.

John Waldrop,
State Statistician

U.S. CENSUS OF AGRICULTURE - OKLAHOMA FARM DATA IN BRIEF

I T E M	: 1974 1/	: 1978	: 1982

OKLAHOMA CROP—WEATHER SUMMARY

Agricultural Statistics Board

Oklahoma Agricultural Statistics Service

1985 CROP WEATHER REVIEW

January: Cold, wet weather increased supplemental feeding of livestock and kept wheat in winter dormancy. Light freeze damage occurred over most of Oklahoma. Cotton harvest was delayed by extremely wet December weather, snow cover, and below normal January temperatures. Many cattlemen rationed their use of forage in order to make it last through the winter.

February: Record rainfall was received in many areas of the State. Cold temperatures early in the month finally gave way to a warming trend. Many low-lying wheat fields were flood damaged from torrential rainfall, particularly in northeast Oklahoma. Supplemental feeding of cattle remained heavy. Swine producers were disturbed by a sudden outbreak of pseudorabies.

March: Cool, cloudy weather retarded wheat development. Over twice the normal amount of precipitation was received. Soil-borne mosaic disease was observed in northern Oklahoma. Small grain topdressing and row crop seedbed preparation were delayed by frequent showers. Although pastures received ample moisture, forage remained short due to the lack of sunshine and heavy grazing through the winter.

April: High winds, hail, and heavy rain caused damage to crops, animals, and farm equipment. Northwest Oklahoma received the brunt of the damage. Temperatures were above normal causing wheat to make excellent growth and development. By the end of the month, harvest was expected to run 10 to 15 days earlier than normal. Pasture and range conditions were the best in over 5 years.

May: Warm, dry weather helped wheat make good progress. By the end of the month, over 15 percent of the wheat in the southwest district was harvested. Early yields were good; however, a weakened plant condition from a severe epidemic of tan spot and leaf rust diseases followed by hot, dry weather during the critical kernel-filling stage reduced yields. Pastures improved and by the end of the month, 20 percent of the counties reported surplus forage supplies.

June: Despite isolated heavy rains, wheat harvest finished well ahead of average. Extremely hot, dry conditions during late development stages caused wheat kernels to shrivel resulting in lower yields than pre-harvest expectations. Row crop planting and hay harvest advanced ahead of schedule immediately after wheat harvest. Grasshoppers plagued many farmers in western Oklahoma.

July: Late planted row crops were showing early signs of stress from the hot, dry weather. Widespread, localized showers during mid-July and again in late-July brought relief to some areas. Cooler temperatures during late-July helped reduce crop stress. Insect activity and disease problems were near normal. Control measures were needed in some areas where grasshopper populations reached damaging levels. Rains revitalized native grass pastures.

August: Some areas reported the hottest and driest August in several years. The Climate Analysis Center reported that nearly 3 inches of additional precipitation were needed to end drought conditions in normally moist southeastern Oklahoma. Enough soil moisture was available for row crop growth in northern areas. Wheat growers were awaiting additional moisture for final seedbed preparation and planting.

September: Near normal temperatures in early September gave way to cool, wet weather when a strong cold front passed through the State. Abundant moisture, particularly in the northwestern third of Oklahoma, aided small grain planting and late row crop development. At the end of the month, corn was 90 percent harvested, sorghum 25 percent, soybeans and peanuts 10 percent, and cotton 5 percent.

October: Good rainfall promoted wheat growth but caused delays in row crop harvest. Approximately 10 percent of the wheat acreage was being grazed by the end of the month, well above average. Cotton and sorghum crops developed quicker than usual and harvest was ahead of average. Peanuts and soybeans were behind the normal harvesting pace because of persistently wet weather in the south and east. Nearly all of the corn was harvested by the end of the month.

November: Cold temperatures during late-month slowed wheat pasture growth and damp fields delayed row crop harvest. Weather conditions restricted fertilizer application and hindered weed and disease control. The abnormally wet fall dampened row crop output.

December: Plentiful rainfall and above normal temperatures improved wheat conditions. By the end of the month, slightly over 40 percent of the wheat acreage was being grazed. Late seeding of wheat after soybeans didn't materialize for many eastern Oklahoma farmers because of prolonged wet fields. No major freeze damage occurred.

OKLAHOMA CROP PRODUCTION

Agricultural Statistics Board

Oklahoma Agricultural Statistics Service

1985 CROP REVIEW

The State's 1985 crop production was dramatically affected by weather conditions throughout the year. First, hot temperatures in the spring substantially reduced small grain prospects. Then, near-ideal summer temperatures and rainfall promoted hay and row crop production. Finally, a wet autumn hampered row crop harvest.

Wheat, Oklahoma's principal cash crop, was adversely affected by environmental conditions. In May 1985, the crop was headed for a banner year when scorching temperatures severely reduced test weights, primarily in North Central localities. Crop diseases (leaf rust and tan-leaf spot) were more damaging than anticipated and further reduced the size and quality of the crop. Oklahoma's final wheat yield was the lowest in four years. Yields were also less for oats and barley, but rye yield was a bushel higher than the previous year.

Summer growing conditions were favorable for row crops. Cool, wet weather during the fall delayed harvest activities. As a result, harvest carried over into the new year. Quality of the crops became lower as harvest was prolonged. Despite the less than ideal harvesting conditions, 1985 row crop production surpassed 1984's drought-reduced crop.

Excellent summer growing conditions pushed the State's hay production to a record high level. In addition to record high yields for alfalfa and other hay crops, harvested acreage was the highest in several years. Hay stocks carried into the new year were at an all-time high.

Minor crops experienced an average year in 1985. Pecan production totaled 10 million pounds while peach output netted 8 million pounds.

OKLAHOMA LIVESTOCK

Agricultural Statistics Board

Oklahoma Agricultural Statistics Service

OKLAHOMA LIVESTOCK - JANUARY 1, 1986

Oklahoma's cattle and calf inventory on January 1, 1986, decreased moderately from a year earlier. Annual average prices received in 1985 decreased for all cattle and hogs, but increased for calves and sheep and lambs.

Cattle and calves on Oklahoma farms and ranches totaled 5,200,000 head on January 1, 1986, down 2 percent from the previous year. The State's cow inventory totaled 1,950,000 head and was composed of 1,837,000 beef cows and 113,000 milk cows, down 8 and up 6 percent respectively from a year earlier. The number of calves under 500 pounds was down from January 1, 1985. The average inventory value of $325 per head gave a total dollar value for all cattle and calves on the State's 65,000 cattle operations of $1.69 billion, 2 percent below the value a year earlier.

Ample rainfall in the spring months boosted pasture conditions to good to excellent, and wheat pasture in the fall of 1985 was better than it has been in several years. At the beginning of the year, steer prices declined seasonally until September, recovering to year earlier levels during the fall.

The number of cattle and calves in Oklahoma feedlots on January 1, 1986, was 9 percent below the previous year and 11 percent below the all time high on January 1, 1978. Fed cattle marketings during 1985 were 9 percent above a year earlier, but 10 percent below the record number marketed in 1978. Cattle and calves placed on feed during the year were down 5 percent from 1984.

Hog numbers as of December 1, 1985 totaled 200,000 head on the State's 6,000 hog operations. Total hog inventory was down 9 percent; breeding stock was up 36 percent while the number of market hogs was down 14 percent from December 1, 1984. The 1985 pig crop was 5 percent more than a year earlier and included 138,000 spring pigs and 137,000 fall pigs. Average value per head of $66.50 resulted in a total inventory value of $13.3 million.

Sheep and lamb inventory increased after a two year decline. Sheep and lambs on Oklahoma's 2,300 sheep farms on January 1, 1986 increased 6 percent from a year earlier and included 70,000 stock sheep and 20,000 sheep and lambs on feed. The 1985 lamb crop of 60,000 head was unchanged from the previous year. Wool produced during 1985 totaled 646,000 pounds, 19 percent less than the previous year's production. The average value per head of $61.50 was below January 1, 1985, resulting in a 1 percent decrease in total value for all sheep and lambs.

Riley G. Henderson
Agricultural Statistician

CATTLE ON FARMS

Inventory, Supply and Disposition: Balance Sheet estimates; the sum of inventory on hand beginning of year, births and inshipments equals the sum of marketings, farm slaughter, deaths and inventory on hand end of year.

Prices: State prices are as published in the February Agricultural Prices report, and are computed by weighting monthly estimated prices received by farmers, by monthly quantities sold.

1/ December 1, except 1960 which is January 1.

Marketings: Includes animals for slaughter market, as well as younger animals shipped to other states for feeding or breeding purposes. Excludes interfarm sales within the state and farm slaughter. Number of head marketed includes all custom slaughter but liveweight marketings shown in pounds exclude custom slaughter consumed on farms where produced.

Farm Slaughter: Animals slaughtered on farms primarily for home consumption. Excludes custom slaughter for farmers at commercial establishments.

OKLAHOMA DAIRY

Agricultural Statistics Board

Oklahoma Agricultural Statistics Service

1985 DAIRY REVIEW

The average number of milk cows in Oklahoma increased by 3 percent in 1985. Average production per cow increased to 10,755, while total production at 1.2 million pounds was up 5 percent from 1984. Total cash sales increased to $156 million compared to $153 million a year earlier.

The average number of milk cows on the State's farms during 1985 was 110,000 head, 3,000 head above 1984. The average annual output per cow was 10,755 pounds, up 194 pounds (2 percent) from the previous year. The number of farms with milk cows totaled 5,300 in 1985, 12 percent less than 1984.

Oklahoma's dairymen marketed 1.2 million pounds of milk and cream during 1985, 5 percent above 1984 marketings. These marketings accounted for 97 percent of the State's milk production. The remaining production was used for household purposes and fed to calves on farms where produced.

The quantity of whole milk (net whole milk equivalent) utilized in manufacturing dairy products totaled 445.0 million pounds in 1985, compared with 441.0 million pounds in 1984.

Production of creamed cottage cheese, at 9.9 million pounds, was virtually unchanged from a year earlier. Both cottage cheese curd and lowfat cottage cheese increased in 1984.

Total production of frozen dairy products increased 6 percent from 1984 to 17.1 million gallons. Ice cream production totaled 12.4 million gallons an increase of 12 percent from 1984. The output of ice milk decreased 10 percent, while milk sherbet increased 20 percent. Mellorine production decreased 25 percent to the lowest level since records began in 1952.

OKLAHOMA POULTRY

Agricultural Statistics Board

Oklahoma Agricultural Statistics Service

POULTRY REVIEW - 1985

There were 4.6 million chickens (excluding commercial broilers) on Oklahoma's farms and ranches as of December 1, 1985, 10 percent below the inventory of a year earlier. The State's laying flocks totaled 3.8 million hens and pullets, as of December 1, which accounted for 84 percent of the total. Egg production for the year ending November 30, 1985, was 868 million, down 1 percent from a year earlier. Oklahoma placed 21st nationally in egg production. Broiler production increased slightly during 1985, but the price per pound decreased by 3 cents; thus, resulting in a 7 percent decrease in the dollar value of production.

Oklahoma's egg industry is concentrated in the Central and Eastern parts of the State. A major portion of the State's commercial layers was raised in Adair county, which is the year's leader in total layer numbers; and followed very closely by Murray County.

Riley G. Henderson

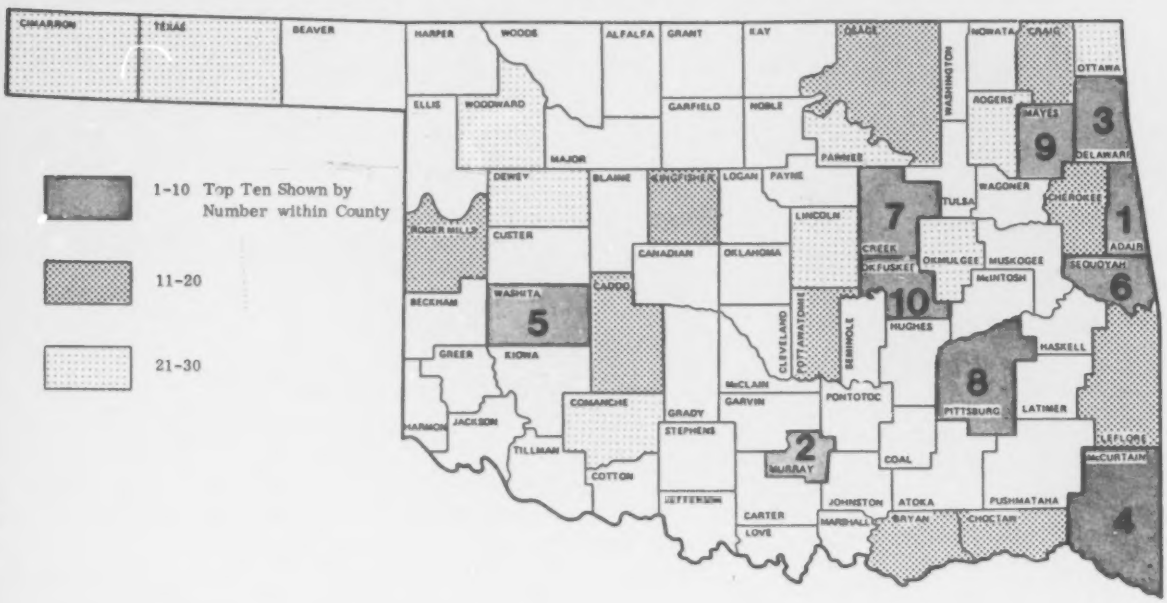
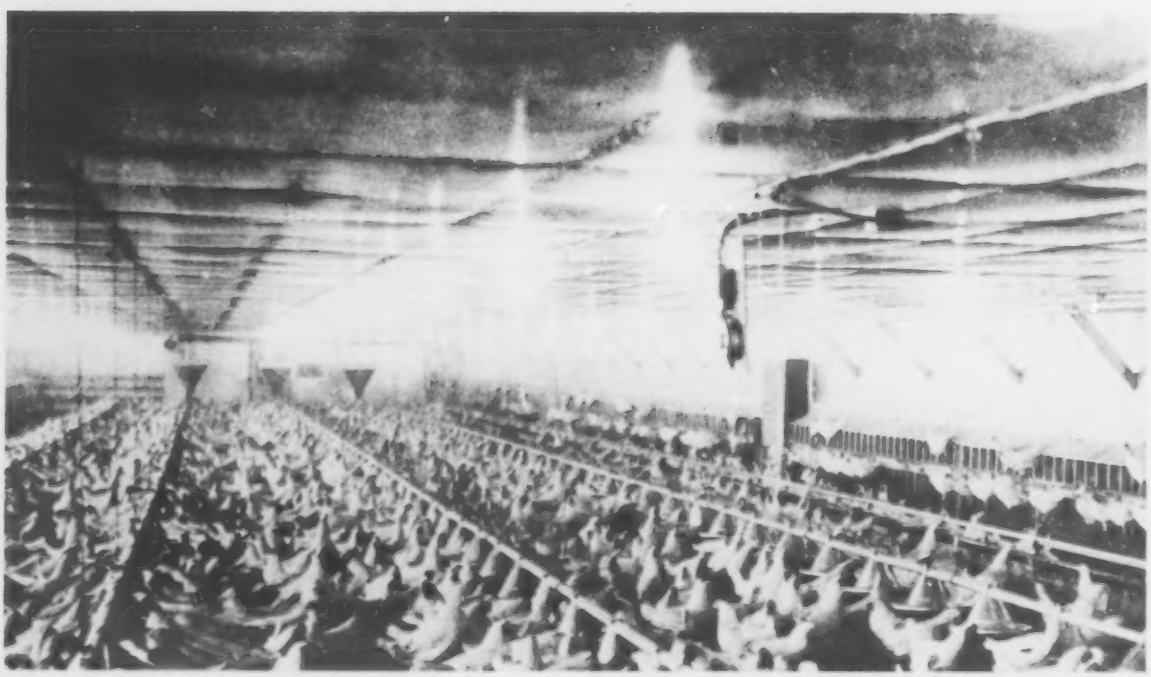
FARM CHICKENS (Excluding Broilers), OKLAHOMA, DECEMBER 1, 1985





Poultry plays an important role in Oklahoma's agricultural industry.

OKLAHOMA AGRICULTURAL PRICES

Agricultural Statistics Board

Oklahoma Agricultural Statistics Service

FARM PRICE REVIEW

The Prices Received Index for all crops in 1985 averaged 123 percent of 1977 = 100 base. Winter wheat averaged $3.20 per bushel in 1985, down 16 cents from 1984's figure. Cotton lint prices decreased 1 percent from 1984 to 47.6 cents per pound, while cottonseed averaged $59.50 per ton, down 42 percent. Season average prices of other crops, and the changes from 1984 were: grain sorghum, $3.90 per cwt., down 59 cents; oats, $1.80, down 10 cents; corn, $2.70 down 40 cents; barley, $2.20, down 20 cents; rye, $2.50 down 50 cents; soybeans, $4.70 down 94 cents. Peanuts were down .6 cent to 26.3 cents per pound and pecans increased slightly to 53.5 cents per pound. Alfalfa hay prices ranged from $120.00 per ton in January to a low of $67.00 in September.

Livestock prices were generally down in 1985 with cattle accounting for most of the decreases. The Index of Livestock and Livestock Products averaged 146 percent of 1977 = 100 base year. All Beef Cattle dropped for the sixth consecutive year, down 2 percent to $49.90 per cwt. Steers and heifers were down $2.30 per cwt., while cows were up $1.10. Calves under 500 pounds brought $3.80 per cwt. more in 1985. Dairy cow replacements cost $10.00 more per head, averaging $870. Prices received for milk averaged $13.40 per cwt., down 40 cents from 1984. Hog prices were off in 1985, averaging $44.60 for the year.

Cash receipts from farm marketings totaled $2.7 billion in 1985, a 2 percent increase from 1984. Cash receipts from sales of crops increased $100 million. Livestock and related products decreased $56 million and accounted for 65 percent of total farm receipts.

Oklahoma farm real estate values decreased 19 percent in 1985. The State average value for farmland and buildings amounted to $566 per acre.

1/ Revised. Details may not add to totals due to rounding.

All income derived from farm operations and Government farm programs is included in the above table. The following description of terms may be helpful in interpreting the table:

Cash Receipts from Farm Marketings - Receipts from sales, loans made or guaranteed by CCC and purchases under price support programs.

Government Payments - Those payments made to farmers in connection with programs such as Agricultural Conservation, Feed Grain, Wheat and Cotton, Disaster Payments, etc.

Non-Money Income - Includes the value of farm products consumed directly in farm households and the rental value of housing provided by farm dwellings. Expenses are included in the production expense estimates, thus non-money imputations do not add on a dollar-for-dollar basis.

Realized Gross Farm Income - The sum of the above income sources.

Farm Production Expenses - Cost of current operations (excludes new capital equipment, taxes, and rents).

Realized Net Farm Income - Realized gross income minus production expenses.

Net Change in Farm Inventories - Value of change in quantities of crops and livestock products kept on farms from one year to the next (may be a minus value).

Total Net Farm Income - Realized net income plus the net change in inventories.

FOREIGN AGRICULTURAL TRADE

Basis for State Estimates

U.S.D.A.'s Economic Research Service (ERS) publishes estimates of U.S. Agricultural Export contributions by States on a fiscal year basis. These estimates by State for major commodity groups were based on the assumption that State contributions to exports are equal to each State's share of production or marketings.

Farm marketing ratios from the census of agriculture or other sources were used to calculate State shares where production statistics by State were not available. State export estimates for wheat were calculated based on export inspections for major types, including hard red winter, spring, and durum. Census Bureau export data groups all wheat types into a single commodity. Wheat export inspections from different port areas yielded information on hard winter, hard spring, soft winter, and durum. Estimates of feeding and ending stocks for feed grains were used along with production by State.

The share-of-production method was used to compute export shares for cotton, cottonseed, soybeans and products, peanuts, and rice. For some commodities, production was not readily available.
